

## Treatment

Rainwater harvesting

Environmentally safe & Organic

Thomzoo©

The implantation of a non-pathogenic aerobic-specific bacterial flora (class 1 European Federation of Biotechnology) allows for breaking down various organic matter materials.

Maintains a perfect balance for aerobic biodegradation.

pH buffer capacity to limit effects of acid rain.

Limitation of the blooming of algae by keeping a balance of carbon/nitrogen/phosphorus.

Water clarifying.

Simple to apply and beneficial for plant growth.

Based on biotechnology (living organisms)  
Explanations & instructions on the back

## INFORMATION ON THE QUALITY OF RAINWATER IN STORAGE TANKS

The quality of rainwater depends on various factors: geographical location – water flow surface – location of the tank, aboveground or underground.

Depending on the nature of the runoff surface, various sediments are being transported: moss, lichen and fungi..... When water becomes stagnant, combined with heat and oxygen depletion, harmful microorganisms can proliferate, which can negatively affect your plants (both in indoor and outdoor), or your vegetable garden when used for watering.

### Recommendations for use:

Biotechnology does not produce instant results; it requires time for the microorganisms to become effective.

### First treatment:

Ideally to be added to a clean tank with fresh rainwater, approx. 50g of powder per 100 l of water, 1 measuring cup.

### Regular treatment:

Depending on how frequently the tank is refilled, add approx. 50g of powder per 200 l of water, 1 measuring cup.

If the water is already contaminated (algae, fungi, smells, murky water, etc..), add approx. 100g of powder per 100 l of water, 2 measuring cups.

Always mix the solution in a bucket or watering can before pouring it into the tank to improve dilution.

### Storage :

Store in a dry and frost-free place, shelf-life 12 months.

### Precaution :

Keep out of children's reach.

---

## COMPOSITION

- Mineral base type Zeolite/lithotamne
- nutrients and mineral salts from agricultural sources
- bicarbonates
- bacteria type *Bacillus subtilis* class1 (EUROPEAN FEDERATION OF BIOTECHNOLOGY)
